

COMP 127: Final Project

Authors: David Acuna, Luis Gonzalez-Xochihua

Overall Premise

The overall goal of the game is for the player to navigate through a linear 2D level as they avoid enemies. They are encouraged to jump on the enemies to increase their score by 100, and reach the end in a fast enough time as the less time a player takes they more points they receive (50 per sec). This makes the game take on 2 approaches, one in which you try to increase your score through defeating enemies, or where the user tries to finish the game quickly. The game is played with arrow keys that moves the player left, right, and up (jump).

Challenges & Solutions

Challenges:

1. Starting the classes
2. Finding the Methods
3. Finding correct hitboxes
4. Developing the movement (fluid)
5. Placing the obstacles
6. Getting Carti to not float on floor/platforms
7. Getting the correct canvas

Solutions:

1. We had to identify what would be most important first
2. Looking at previous methods
3. Referencing Breakout
4. Messing around with bubble blitz alternative movement (gravity)
5. LOTS of trial and error
6. Trying new values and messing with hitboxes
7. Updating numbers (messing with them)

Demo

Score: 0

Time: 225

Lives x3

Reflection

When working on this, it was a lot of trial and error. Unlike Breakout! Where we still had a general idea of where things were supposed to work like, everything here started from scratch. The first thing that had us come to this realization was the movement, we realized it was a lot harder than just making a cube move left/right and jump as we had to consider the gravity and logic. This then applied to make many other things, such as the logic of the enemies, working with hitboxes and slowly realize that if we wanted to incorporate new features that we would have to make changes to previous classes/methods for them not to bug. With time we also realized that features we wanted were not going to make the final cut, such as moving platforms, power ups, crouching, ect. Overall it put into perspective how much goes into creating so many little “simple” features.
